平成30年度に交付を受けた特別研究推進費に係る研究実績について、次のとおり報告します。

研究課題名	第二言語習得：日本語の語彙テストの発展					
実施内容・研究成果の要旨 (概要書を別途添付)	<p>Two studies investigating the validity of my Japanese vocabulary size test were carried out. An online vocabulary size test containing 13,881 items was created from the NINJAL Japanese language corpus. Additionally, false words were added to this body of words in order to validate the test. The entire group of words was divided into 8 groups, and 107 native speakers of Japanese judged one of the 8 groups by saying whether they knew the word or not. From this data, I could then rank which words Japanese speakers know more frequently, using reaction times and creating a prevalence rating for each word. Using this method, the average vocabulary size for Japanese speakers was found to be about 150,000 words. From the results of this test I created another test with about 1530 real words and false words (about a 2:1 ratio of real words to false words). I then recruited 50 non-native speakers of Japanese from various first language backgrounds to take the test. The results of both of these studies will be used to create a much shorter test that will be available to the public in the future and can be used to determine an individual's vocabulary size in Japanese.</p>
